

Category	Quality attribute	Description
Run-time Qualities	Availability	Availability defines the proportion of time that the system is functional and working.
	Fault Tolerance	Fault Tolerance defines the ability of the system to continue being responsive upong failure of components of the system. The behavior upon such failures may be degraded or limited.
	Interoperability	Interoperability is the ability of a system or different systems to operate successsfully by communicating and exchanging information with other external systems written and run by external parties.
	Manageability	Manageability defines how easy it is for system administrators to manage the application, usually through sufficient and useful instrumentation exposed for use in monitoring systems and for debugging and performance tuning.
	Customizability	Customizability defines the ability of a system to be personalized by the user to change either the way it looks or it behaves to a certain degree.
	Performance	Performance is an indication of the responsiveness of a system to execute any action within a given time interval.
	Precision	Precision defines the ability of the system to obtain numerical results in sufficient level of detail.
	Reliability	Reliability is the ability of a system to remain operational over time.
	Scalability	Scalability is ability of a system to either handle increases in load without impact on the performance of the system, or the ability to be readily enlarged.
	Auditability	The ability to conduct a review and examination of system records and activities in order to test the adequacy and effectiveness of data security and data integrity.
	Security	Security is the capability of a system to prevent malicious or accidental actions outside of the designed usage, and to prevent disclosure or loss of information.
Design Qualities	Conceptual Integrity	Conceptual integrity defines the consistency and coherence of the overall design.
	Maintainability	Maintainability is the ability of the system to undergo changes with a degree of ease.
	Portability	Portability defines the ability to use the same system under different environments.
	Reusability	Reusability defines the capability for components and subsystems to be suitable for use in other applications and in other scenarios.
System Qualities	Supportability	Supportability is the ability of the system to provide information helpful for identifying and resolving issues when it fails to work correctly.
	Testability	Testability is a measure of how easy it is to create test criteria for the system and its components, and to execute these tests in order to determine if the criteria are met.
User Qualities	Accessibility	Accessibility is the practice of making your websites usable by as many people as possible.
	Usability	Usability defines how well the application meets the requirements of the user and consumer by being intuitive and resulting in a good overall user experience.
